

xin chào

Hey, I'm Phan Tấn Tài

Full-stack engineer with 2.5+ years of production experience at Simplamo Vietnam, shipping features across React / Next.js, React Native, and NestJS microservices. I build things that perform – from AI-powered assistants to automated reporting pipelines – and I obsess over the gap between code that works and code that actually scales.

Experience

- Junior Full-Stack Engineer

Simplamo Vietnam (Technology Company) • Jan 2024 - Present

 - Dashboard system with 20+ interactive widgets — reduced initial load time by ~50% via component splitting, memoization, and render batching.
 - Shipped AI chat (React Native) and AI assistant (Next.js) integrated into core user flows; became the fastest-adopted features in Q2 2024.
 - Built an automated report pipeline: Puppeteer + Cron + RabbitMQ + AWS SES delivery — eliminated 100% of manual report generation for the entire user base.
 - Google Calendar two-way sync with conflict resolution and timezone handling across a multi-tenant SaaS architecture.
 - Built Personnel Performance tracking module — aggregates individual KPI results by month/quarter/year, enabling data-driven compensation and bonus decisions for managers.
 - Maintained and extended NestJS microservices (MongoDB + RabbitMQ) — leveraged aggregation pipeline for complex cross-collection queries; zero unplanned downtime across all feature releases.
 - Integrated Cursor AI into daily development workflow — used for code generation, refactoring, and architecture planning; consistently reduced implementation time on complex features across both frontend and backend.
- Front-end Engineer

Simplamo Vietnam (Technology Company) • Jun 2023 - Dec 2023

 - Built 30+ reusable UI components (shadcn/ui + Tailwind) — cut new-screen implementation time by ~40% across the team.
 - Engineered JWT + multi-tenant auth flow (token rotation, tenant context, protected routes) — zero security incidents throughout the rollout.
 - Reduced unnecessary re-renders across CRM modules by applying memoization (React.memo, useMemo, useCallback) and optimizing MobX-State-Tree observers — improved UI responsiveness noticeably in data-heavy views.
 - Built 30+ transactional email templates using Handlebars — covering onboarding, notifications, and automated reports, used across the entire product.
 - Collaborated in Agile sprints with backend engineers and designers — consistently hit sprint commitments in a fast-paced startup environment.

Education

- Trường Đại học Ngoại ngữ - Tin học Thành phố Hồ Chí Minh (HUFLIT)
- Bachelor's degree in Software Engineering • 2022 – 2026
